ABSTRACT

This report presents population estimates for July 1, 1974, and provisional estimates for July 1, 1975, for all counties and county equivalents in the United States, by state. Estimates are also shown for standard metropolitan statistical areas, New England county metropolitan areas, and 13 standard consolidated statistical areas. The estimates, representing a compilation of figures published previously in separate reports, were developed jointly by state agencies and the Bureau of the Census. The publication's introduction contains a brief analysis of the findings and a description of methodology used in compiling the estimates. The analysis shows that there is a continuation of large regional shifts in the U.S. population. Migrants are leaving the larger and older urban centers in the Northeast and the North Central regions and are moving to metropolitan areas in the South and West. Approximately 95% of the publication consists of detailed tables. (Author/RM)

# ESTIMATES OF THE POPULATION OF COUNTIES AND METROPOLITAN AREAS: JULY 1, 1974 AND 1975

This report presents population estimates for July 1, 1974, and provisional estimates for July 1, 1975, for all counties and county equivalents in the United States, by State. These include parishes in Louisiana, census divisions in Alaska, and independent cities in Maryland, Missouri, Nevada, and Virginia. Estimates are also shown for standard metropolitan statistical areas (SMSA's), New England county metropolitan areas (NECMA's), and 13 standard consolidated statistical areas (SCSA's) as defined by the Office of Management and Budget through December 1976.[1] Rankings of SMSA's, SCSA's, and counties by population size for both 1970 and 1975 also are presented, as well as rankings by percent population change and net migration rates for selected counties.

The estimates shown here represent a compilation of figures published previously in separate reports, with the addition of estimates for SMSA's. Most of the county estimates were developed jointly by designated State agencies and the Bureau of the Census under the Federal-State Cooperative Program for Population Estimates. In this program, estimates were published for 44 States in **Current Population Reports**, Series P-26, Nos. 75-1, 75-3 through 75-19, 75-22 through 75-31, 75-33 through 75-42, 75-44 through 75-46, and 75-48 through 75-50. The six remaining States—Alaska, Maryland, Massachusetts, New York, Texas, and Washington—chose not to publish in Series P-26. The results shown here are those presented in Series P-25, Nos. 638, 629, 633, 631, 637, and 624, respectively.

The SMSA's in table 1 are listed in alphabetical order together with their constituent counties. For New England metropolitan areas, however, where towns rather than counties are the components of SMSA's, estimates are shown for the nearest equivalent NECMA. New SMSA's and changes in definitions of existing SMSA's made since the 1970 census are identified by an asterisk in table 1.

A standard metropolitan statistical area consists of a county containing a city of 50,000 inhabitants or more. Contiguous counties are included in an SMSA if they are metropolitan in character and are socially and economically integrated with the central city. A county containing a city of less than 50,000 population may constitute an SMSA if the addition of densely settled adjacent places would bring the city up to the 50,000 level and the SMSA has at least a 75,000 population. With only two exceptions, the central cities of each SMSA are specified in the title of the SMSA. A detailed explanation of the criteria used in establishing SMSA's appears in **Standard Metropolitan Statistical Areas**, Executive Office of the President, Office of Management and Budget, Revised Edition, 1975.

The 13 standard consolidated statistical areas which appear in this report represent large metropolitan agglomerations consisting of groups of adjacent SMSA's. The two criteria for inclusion in this classification are: (1) the areas must meet a minimum level of intercommuting, and (2) there must be a general sharing of a continuous urban mass as indicated by overlapping or adjacent urbanized areas. SCSA's are designated only when one of the adjacent SMSA's has a population of at least one million.

The county and SMSA estimates presented in this report have been rounded to the nearest hundred without being adjusted to the State total, which was independently rounded to the nearest thousand. Percentages are based on unrounded numbers. Births and deaths are taken from reported vital statistics from April 1, 1970, to December 31, 1974, with extrapolations to June 30, 1975. Net migration is the residual difference between net change and natural increase or decrease. The 1970 census populations reflect all corrections to the census count made subsequent to the release of the official State figures.

[1] The Office of Management and Budget designated five new SMSA's as of June 13, 1977. The five new metropolitan areas are: Grand Forks, North Dakota-Minnesota; Kokomo, Indiana; Lawrence, Kansas; Panama City, Florida; and Bradenton, Florida.

## ESTIMATES OF THE POPULATION IN METROPOLITAN AREAS

**Standard Metropolitan Statistical Areas.** The SMSA rank listings in table 2 illustrate that, for the most part, there is a continuation of large regional shifts in the U.S. population. Migrants are leaving the larger and older urban centers in the Northeast and the North Central regions and are moving to metropolitan areas in States in the South and West (see **Current Population Reports**, Series P-25, No. 640). Some exceptions to this trend do occur as illustrated by the Los Angeles-Long Beach, California and Seattle-Tacoma, Washington SMSA's. Both of these large metropolitan areas declined in rank between 1970 and 1975. Although in these two particular cases the shifts may be due to short-range economic fluctuations, it would appear, based on county growth trends discussed later in this report, that much of the migrant population is relocating in fringe areas immediately outside of existing SMSA's. This is causing a suburban spillover into nonmetropolitan areas, thereby, contributing to the 6.5 percent nonmetropolitan growth between 1970 and 1975.[2] Nonmetropolitan areas experienced an absolute change of approximately 3.5 million people during this five-year period, representing about 36 percent of the total U.S. change. Metropolitan areas, on the other hand, increased by an estimated 6.2 million over this same span. Approximately 156 million people, or 73.3 percent of the U.S. population, are estimated to have been living in metropolitan areas as of July 1, 1975. This proportion is relatively unchanged since 1970.

The total national growth of almost 10 million people over five years occurred during a period of marked decline in natural increase (births minus deaths). This decline has reduced the growth rates of both the metropolitan and nonmetropolitan population alike and increased the importance of net migration as a determinant of population change in many areas of the country. Lowered growth stemming from diminished immigration or increased outmigration, however, is confined mainly to the largest metropolitan areas and to the smaller SMSA's in the Northeast and North Central regions. This trend suggests that size and location rather than metropolitan-nonmetropolitan character are major factors determining population growth and redistribution (table A).

One interesting footnote to table A is the evident change in migration patterns. From these regional breakdowns, it is apparent that since 1970 nonmetropolitan areas in the North Central, Southern, and Western regions are exhibiting migration trends that were emerging during the 1960's in the Northeast. During the 1960's, movement into nonmetropolitan areas in this region was already averaging about 2,000 persons per year.

During the five years between 1970 and 1975, the South and West increased their proportion of the total U.S. population from 48 percent to 49.7 percent while the U.S. metropolitan proportion remained virtually unchanged at 73.3 percent (tables 6 and 7). This indicates that migrants are, indeed, moving to the South and West but that they are more likely to be going to metropolitan than nonmetropolitan areas. In fact, less than one-third of the total net inmigrants to these two regions settled in nonmetropolitan places.

All 15 of the fastest growing metropolitan areas are located in the South and West, nine of which are in Florida (table B). Migration contributes the overwhelming proportion of the growth in all of these areas. However, in three of the Florida SMSA's (Sarasota, Tampa-St. Petersburg, and Daytona Beach) the occurrence of more deaths than births actually lowers the increases that would result from migration alone. This phenomenon is becoming more widespread as migrants in older age groups move to areas where low fertility levels prevail. Despite this, all 15 SMSA's are estimated to have increased their populations by between 23 and 50 percent during this five-year period.

The use of the standard consolidated statistical area concept to cover large areas in addition to New York and Chicago provides a more realistic appraisal of large metropolitan complexes than can be made using SMSA's alone (tables 3 and 4). According to table 3, the New York-Newark-Jersey City SCSA, the largest urban agglomeration in the nation, experienced a negative growth rate resulting from rather substantial amounts of net outmigration. In fact, all of the SCSA's except for Houston-Galveston, Texas, Miami-Ft. Lauderdale, Florida, and San Francisco-Oakland-San Jose, California experienced net outmigration between 1970 and 1975. Natural increase, however, compensated for these migration losses and caused positive percent changes in all but three of the SCSA's.

[2] Nonmetropolitan population includes all counties that are not contained within an SMSA. Metropolitan and nonmetropolitan areas in this report reflect current definitions, which increase the number of metropolitan counties since 1970 by 180

## ESTIMATES OF THE POPULATION IN COUNTIES

**Percent change and net migration.** The 25 counties in the United States with the largest positive population growth rate between 1970 and 1975 range in size from 400 to 134,900 people in 1975 (table C). These counties have one characteristic in common—extensive net inmigration. Because of this, all but one are ranked among the 25 counties in the nation with the largest net inmigration rates (table 9). Natural increase constitutes a relatively substantial part of the change in only one county—Duchesne County, Utah. The surplus of resident births over resident deaths here contributes 23.4 percent of the total change between 1970 and 1975. This occurrence is particular to Utah where the birth rate is generally higher than for other States.

Not only is natural increase becoming a less important component of county population change, natural decrease, or more deaths occurring than births, now is a factor affecting the growth of some of the fastest growing counties. This ironic situation is especially evident in Citrus County, Florida, where net migration between 1970 and 1975 increased the 1970 population by about 100 percent. However, natural decrease caused the total population change to be only 97.3 percent. As mentioned previously, this unusual event is the result of continuing declines in the birth rate coupled with rapid inmigration of persons in the older age groups.

All of the counties in table C are located in Southern and Western States, emphasizing again that migrants are leaving the large industrial Northeast and North Central regions to move to rapidly growing areas in the South and West. This trend supports regional migration patterns established since 1970 and discussed earlier in this report for metropolitan areas, as well as for States in **Current Population Reports**, Series P-25, No. 640.

In addition to their geographic locations, 16 of these counties are nonmetropolitan in character and 7 are not adjacent to currently existing SMSA's. The seven nonadjacent counties include: Summit and Hinsdale Counties, Colorado; Citrus

County, Florida; Alpine County, California; Douglas County, Nevada; Sweetwater County, Wyoming; and the Angoon Census Division in Alaska.

On the opposite end of the spectrum are the 25 counties with the largest rates of population decline (table D). Except for the five Texas counties (Loving, McMullen, Motley, Marion, and Stonewall) where natural decrease contributes from 0.6 to 2.5 percent of the total loss, net outmigration is the sole cause for the population declines. All but 6 of these losing counties are also [illegible] Among the 25 counties having the largest [illegible] percent net migration between [illegible] table 10). In eight of the counties [illegible] contribute to the [illegible] with one case [illegible] Chattahoochee County, Ge[illegible] loss of approximately [illegible] and 1975; constituting 94.3 [illegible] the total outmigration for the county. The [illegible] neighboring Stewart County, Georgia, which contains no military installation but is adjacent to Chattahoochee County, had a net outmigration rate of 16.1 percent. This loss probably represents dependents of military personnel stationed at Fort Benning. Newport County, Rhode Island is another area tremendously affected by military losses. The closing of naval bases in this county resulted in a net outmigration rate of 24 percent. Other counties reflecting substantial military declines include: Dale County, Alabama; Pulaski County, Missouri; Gilliam County, Oregon; Palo Pinto County, Texas; and Arlington and Prince George Counties, Virginia.

Even though most large central cities are declining in population size, St. Louis, Missouri, is the only city listed in this table due to its independent status, (as opposed to a city contained within a county jurisdiction). The only other highly urbanized area presented here is Arlington County, Virginia, which declined by approximately 18,000 persons during this five-year period over and above a drop in military personnel stationed in the county.

The remaining 15 counties are relatively small nonmetropolitan counties, all having populations of less than 15,000, only two of which (West Feliciana Parish, Louisiana and Stonewall County, Texas) are adjacent to SMSA's. This would indicate that,

despite recent migration reversals in several nonmetropolitan counties, the trend has been far from universal.

Ironically, 16 of the counties with large percentages of net outmigration are located in the south where 11 of the fastest growing counties are also situated. The remaining nine counties are distributed throughout the West, North Central and Northeast regions and, except for Newport County, Rhode Island, all are inland from coastal regions.

**Size of county.** By arranging the counties into size classes (as determined by their 1970 census populations), a more meaningful comparison can be made since the magnitude of the percent change is, in part, determined by the population size of the county. For instance, the county with the greatest percentage increase in the nation, Summit County, Colorado, grew by 104.1 percent between 1970 and 1975. This growth, however, represents a total increase of only about 2,800 persons. Broward County, Florida, on the other hand, increased by only 39.1 percent over this same interval, but this is equivalent to an addition of approximately 242,000 persons. This size factor, then, is the main reason that large counties are not included among the 25 counties in the nation with the largest growth rates.

It should be noted that tests of methods indicate that the average error of estimation is greater for small counties and for those counties that have growth rates which deviate greatly from the national norms.[3] Consequently, interpretation of the rankings of the growth in small counties may be affected to a greater degree by the error of estimation than those in larger size categories.

**Counties of 500,000 or more.** All of the fastest growing counties over 500,000 in size (except for Suffolk County, New York which is part of the Nassau-Suffolk SMSA and is adjacent to New York City) contain a large city within their boundaries or are located in SMSA's with large central cities (table 11). Counties with a 1970 population of 500,000 or more, together with the name of their constituent central city or the SMSA in which they are located, are shown in table E.

Unlike most of the fastest growing counties presented in table 9, several of the counties with populations of 500,000 or more acquire a relatively substantial proportion of their growth from natural

increase (table 11). The prominence of this component of change is a result of the population composition of these counties, that is, central city residents with comparatively high fertility levels and suburban areas populated primarily by families in child-bearing age groups. In fact, natural increase also serves to counteract, in part, the losses from net outmigration that these fast-losing, large metropolitan counties are experiencing. New York County (Manhattan Borough), New York, which is one of the five counties constituting New York City, is an exception. Here, natural decrease as a result of relatively low fertility levels and a changing age composition is occurring and contributing to the estimated decline of 84,600 persons.

Among the other fastest losing counties of 500,000 or more persons are two—Denver County, Colorado (Denver) and Fulton County, Georgia (Atlanta)—that are components of SMSA's where three of the counties with the largest positive percent change in the nation are located (table 9). These conflicting growth patterns are partly offsetting due to a continuing process of suburbanization. That is, the large growth in Douglas County, Colorado and Gwinnett and Douglas Counties, Georgia is at the expense of the counties where the central city is located.

This phenomenon is illustrated again in this table for counties with populations greater than 500,000. For example, Contra Costa County, California, which is a suburb of San Francisco, shows growth between 1970 and 1975 even though the population of San Francisco is declining. Similarly, Washington, D.C. registered losses while Montgomery County, Maryland (a suburb of Washington) increased by approximately 41,000 during this five-year period.

**Counties of 100,000 to 499,999.** This size category includes two nonmetropolitan counties among the 20 fastest growing. These two counties (Ocean County, New Jersey and San Luis Obispo County, California) are adjacent to SMSA's and are probably more metropolitan than nonmetropolitan in character.

Net migration is the primary component of population growth in all but Utah County, Utah, where natural increase constitutes 70 percent of the total change between 1970 and 1975. As mentioned previously, Utah is an exception because of its high birth rates and relatively young age distribution.

The six Florida counties listed in this size category are typical of the phenomenal growth that the entire State has been experiencing as a result of large numbers of inmigrants.

Included in this group is one independent city, Virginia Beach, Virginia, which is part of the Norfolk-Virginia Beach-Portsmouth SMSA. Even though this city grew rapidly between 1970 and 1975, both Norfolk and Portsmouth are among the 20 fastest losing counties in the same size category. A significant loss in military personnel stationed in these two independent cities is a major factor contributing to their large population decreases. Virginia Beach, on the other hand, is a popular resort and retirement area.

Many of the losing counties in this size category contain a central city within their jurisdiction that is experiencing population declines, and all but one are geographically located in North Central or Southern States.

**Counties of 50,000 to 99,999.** As the county size categories decrease, the number of nonmetropolitan counties that are rapidly growing tends to increase. There are six nonmetropolitan counties listed among the 20 fastest growing counties in this category. Three of these are adjacent to expanding SMSA's, and the remaining two—Barnstable, Massachusetts and St. Lucie, Florida— are resort and retirement areas. As with the majority of all growing and losing counties, net migration is the primary component of change in all of these counties.

Nine of the 20 fastest losing counties in this size group can attribute much of their outmigration to large military losses. The other 11 counties comprise the following mixture: four nonmetropolitan counties; four metropolitan counties located in relatively small SMSA's (under 250,000 persons in 1970); one county in a large SMSA (Cincinnati); and two Virginia independent cities.

**Counties of 10,000 to 49,999.** Nine of these counties were discussed previously with reference to the nation's 25 fastest growing counties (table 9). The remaining 11 counties include five that are nonmetropolitan but adjacent to existing SMSA's. Consistent with most of the rapidly growing counties, all but one (Sherburne County, Minnesota) are located in either the South or West.

Six of the fastest losing counties in this size class were discussed earlier since they are also included among the 25 counties with the largest negative decreases nationally (table 10). All of the remaining counties are nonmetropolitan and are not adjacent to metropolitan areas.

**Counties of 5,000 to 9,999.** The growing counties in this size category that were not mentioned in conjunction with the 25 highest growth counties can be divided into the following groupings: recreational areas in Colorado, Idaho, Michigan, and Montana; growing suburban counties; and rural regions where searches for new energy sources are taking place. Cavalier County, North Dakota, is the one ex-

ception, with recent military construction being responsible for the 5-year spurt of growth. The 20 fastest losing counties are all nonmetropolitan in character and are distributed throughout the Southern, North Central, and Western regions.

**Counties under 5,000.** Four of the counties listed among the fastest growing in this size class lost population between 1960 and 1970. These counties are: Flagler County, Florida; Hickory County, Missouri; Sutton County, Texas; and Kane County, Utah. These four counties are nonadjacent to existing SMSA's, and none had towns of greater than 2,500 people in 1973. Although their growth since 1970 is a trend reversal, all four of these counties had population changes of less than 2,000 people of the 5-year period.

Of the fastest losing counties, 10 are among the 25 counties in the entire United States with the largest negative change (table 10). All are nonmetropolitan and are sufficiently small that the slightest change in population can cause a substantial percentage change. For example, in four counties—Banner County, Nebraska and Kenedy, King, and Loving Counties, Texas—the loss between 1970 and 1975 is less than 100 persons.

## METHODOLOGY

The July 1, 1974 county estimates are an average of the Regression method, Component Method II, and the Administrative Records method estimates.[4] The provisional July 1, 1975 estimates for large metropolitan counties were developed by taking the average change between 1974 and 1975 estimates based on Component Method II and the Housing Unit method, and adding this change to the 1974 estimates. The provisional July 1, 1975 estimates for the remaining counties are the result of adding to the 1974 estimates, the change between 1974 and 1975 Component Method II estimates.

There are nine States where exceptions to the above procedure were made:

- In four States—Kansas, Missouri, Nebraska, and Washington—the provisional July 1, 1975 estimates were computed by adding the average change between 1974 and 1975 estimates based on Component Method II and the Regression method to the 1974 estimates.
- In Arizona, no Housing Unit method estimates were used in developing the provisional estimates.
- The procedure for developing July 1, 1974 estimates for California counties included an additional method, the Driver License Address Change Composite Migration Estimating Method (DLAC),[5] which was averaged in with the other three methods. In addition, for 1975, the DLAC, Regression method, and Component Method II estimates were used for all California counties in lieu of Housing Unit method estimates.
- The July 1, 1974 estimates for Florida are averaged estimates derived from four methods: Component Method II, the Regression method, the Administrative Records method, and the Housing Unit method. Also, the provisional estimates for Florida counties were developed using Component Method II and Housing Unit method estimates in computing the 1974-1975 change for all counties.
- The estimates for Massachusetts were developed by adjusting the results of the State census conducted by the Commonwealth of Massachusetts on March 1, 1975 (modified to be consistent with the resident population definition) to the appropriate estimate date.
- In Wisconsin, the 1974 estimates for counties with a 1970 population of 25,000 or more were derived from an average of the three standard methods described above, plus the Composite method which estimates various age groups separately and then combines these estimates into an overall estimate of the total resident population.[6] For counties with 1970 populations of less than 25,000, the estimates are an average of the Regression method, the Administrative Records method, and the Composite method estimates.

In Arkansas, California, Florida, and Pennsylvania, adjustments were made to the July 1, 1975 estimates to reflect the number of Vietnamese

[4] Descriptions of methodologies are given in **Current Population Reports**, Series P-25, Nos. 427 and 520. For the regression equations used in estimating the county populations in each State, see the individual Series P-26 or Series P-25 report for the State.

[5] For a detailed description of this methodology see Nelson Rasmussen, "The Use of Driver License Address Change Records for Estimating Intercounty Migration," a paper presented at the Small Area Statistics Conference, St. Louis, Missouri, August 1974.

refugees housed in Sebastian, San Diego, Okaloosa, and Lebanon Counties, respectively. By 1976, these refugee centers were disbanded, therefore, the refugees will not be included as separate entries in the estimates for subsequent years.

Special censuses for counties conducted by the U.S. Bureau of the Census through December 31, 1975, were used in conjunction with the estimated populations. County censuses taken by the Federal-State Cooperative Program agencies in two States—California and Washington—were also used. In all cases, special census results were interpolated or extrapolated to the estimate dates.

For States where no special censuses for entire counties were conducted, the county estimates were adjusted to agree with the independently developed July 1, 1974 and Provisional July 1, 1975 State estimates published in **Current Population Reports**, Series P-25, No. 640. For States where there were special censuses of entire counties, the State populations may differ from those published in Series P-25, No. 640 due to adjustments that were made between the population estimates and special census counts at the county level. Counties which had special censuses for which adjustments were made are footnoted in table 8.

Revised State estimates for July 1, 1975 and provisional estimates for July 1, 1976, are published in **Current Population Reports**, Series P-25, No. 642. County estimates for the same dates prepared under the auspices of the Federal-State Cooperative Program will be published in Series P-26 as they become available. Reports covering every State will be released either in Series P-26 or Series P-25.
